Accelerate Perspectives on Appendiceal Mucinous Neoplasms and Pseudomyxoma Peritonei

Thanks to Accelerator Award, an international network against Pseudomyxoma Peritonei has been teamed up between Italy, United Kingdom, and Spain. The AA project aims to accelerate the whole research against the disease. The collaboration of the major clinical and research centers in the three Countries will allow the creation of the greatest prospective ever made cohort of patients affected by this rare and often unpredictable disease. The AA project will make available all the collected clinical data matched to multiomics, as well as to established organoids culture. The AA findings will be useful to investigate and to improve the prognostic stratification, to guide treatment, and to define new targeted therapies.

The AA project on Pseudomyxoma Peritonei also places emphasis on disseminating and promoting PMP awareness, as well as research progresses, to the non-scientific public, especially affected patients.
